Funnel & Traffic Analysis for Conversion Optimization

Between January and September 2025, the platform recorded **5,680 sessions**, yet only **782 (13.8%) converted into purchases**. This gap highlights potential friction points within the customer journey that may be limiting overall conversion performance.

This analysis aimed to:

Identify **leakage points across the funnel**, evaluate **traffic source effectiveness**, and assess **device performance**. The findings provide **actionable insights to prioritize optimization efforts** in areas with the **highest potential to increase conversions**.

Business Questions

- Where does the most significant drop-off occur within the customer journey?
- Which traffic source generates the highest conversion efficiency?
- How does each device perform in terms of engagement and conversion?
- Which optimization areas should be prioritized to maximize conversion uplift?

Key Findings

- **The primary bottleneck occurs at the Product Page → Add to Cart transition**, with the highest drop-off rate (57%).
- **Users who reach Checkout demonstrate strong purchase intent**, with a 91% step conversion rate to confirmation.
- **Social Media drives the highest traffic volume (37.5%) but delivers relatively lower conversion efficiency** compared to Email and Direct channels.
- **Mobile dominates total traffic (52.8%)**, making it the highest-impact device for optimization.
- **Tablet significantly underperforms across engagement and conversion metrics**, indicating substantial UX-related friction
- **Engagement alone does not guarantee conversion**. The gap between product exploration and purchase completion signals evaluation-stage inefficiencies.

Deep Dive Analysis

KPI Overview

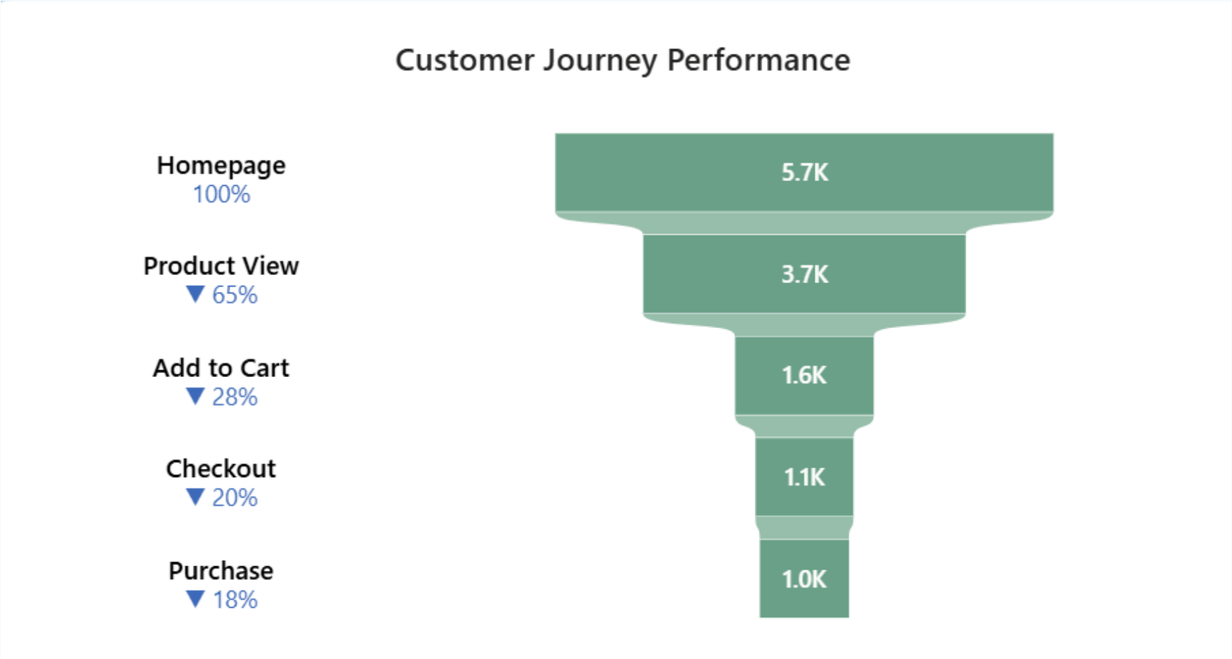
Total Sessions	Total Conversions	Conversion Rate	Avg. Session Duration	Avg. Cart Items
5680	782	13.8%	176s	4

Out of 5,680 sessions, only 782 converted, resulting in a **13.8% conversion rate**. Users spent an average of **176 seconds per session** and added around **4 items to cart**, showing **active product exploration**.

Despite this engagement, **conversions remain limited, indicating mid-funnel leakage** that requires further analysis.

Funnel Drop-off Analysis

The funnel shows a disproportionate drop-off between stages:



- **5.7K sessions** start at the Homepage
- **65% continue to Product View**
- Only **28% reach Add to Cart**

The steep drop between Product View and Add to Cart highlights **significant friction in moving users from product discovery to purchase intent**.

In contrast, the decline from Checkout (20%) to Purchase (18%) is relatively gradual, indicating that **the main bottleneck is not payment execution but the product evaluation stage**, where **persuasion appears insufficient to drive cart commitment**.

Funnel Drop-off Analysis

Funnel Performance Analysis

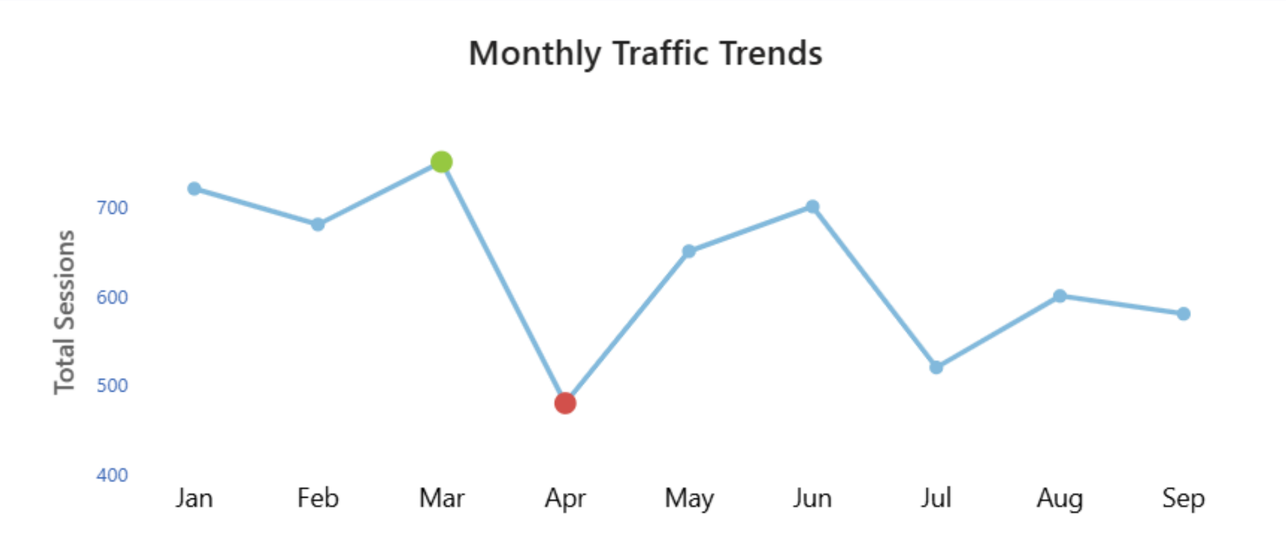
Funnel Journey	Visitors	Proceeded	Drop-offs	Drop-off Rate	Step Conv. Rate
Home → Product Page	5680	3677	2003	35.3%	64.7%
Product Page → Cart	3677	1580	2097	57.0%	43.0%
Cart → Checkout	1580	1116	464	29.4%	70.6%
Checkout → Confirmation	1116	1016	100	9.0%	91.0%

- **Product Page → Cart** records the **highest drop-off at 57%** (2,097 sessions).
- **Checkout → Confirmation** shows a **91% step conversion rate**, indicating strong purchase commitment among users who reach checkout.

This pattern confirms that **once purchase intent is formed, users are highly likely to complete the transaction**. Consequently, **optimization efforts should focus upstream**, particularly in improving the **Product Page to Add to Cart transition** through:

- UI/UX improvements
- Clarifying the value proposition
- Providing higher-quality product content
- Improving traffic relevance

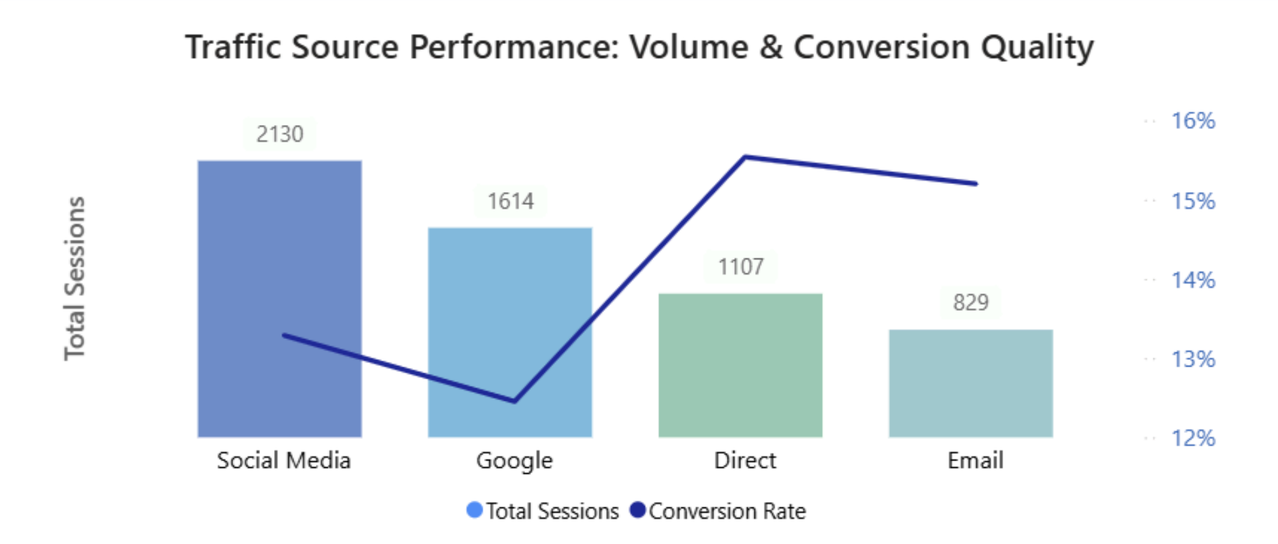
Traffic Performance Analysis



Traffic showed **volatility** throughout the January–September 2025 period, **peaking in March** and **dropping sharply in April** before **rebounding in May–June**. It **dipped again in July** and then **stabilized at a moderate level through August–September**.

The growth in the first quarter, followed by **a V-shaped correction**, was likely driven by period-specific factors, such as temporary campaigns or promotional activities. This indicates that **traffic spikes do not necessarily reflect stable acquisition performance**, highlighting the need for **sustained campaigns** and more **consistent traffic sources**.

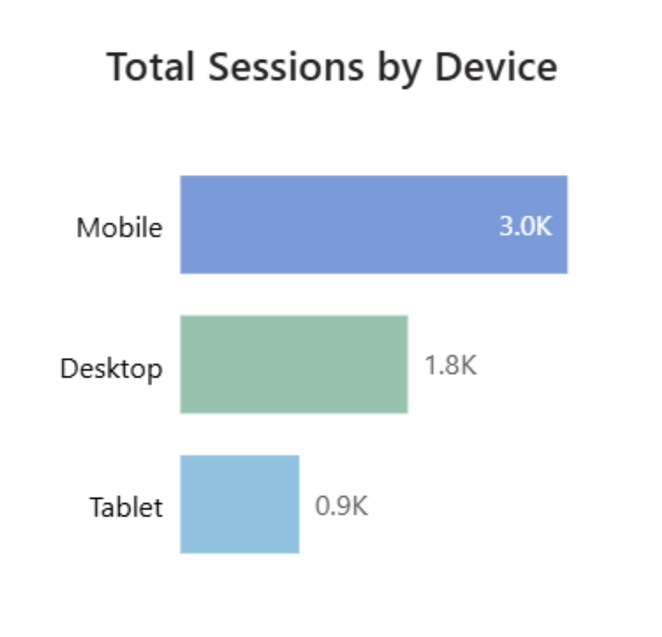
Traffic Performance Analysis



Social Media drives the largest share of traffic (37.5%), but its conversion rate (13.3%) lags behind Direct (15.5%) and Email (15.2%).

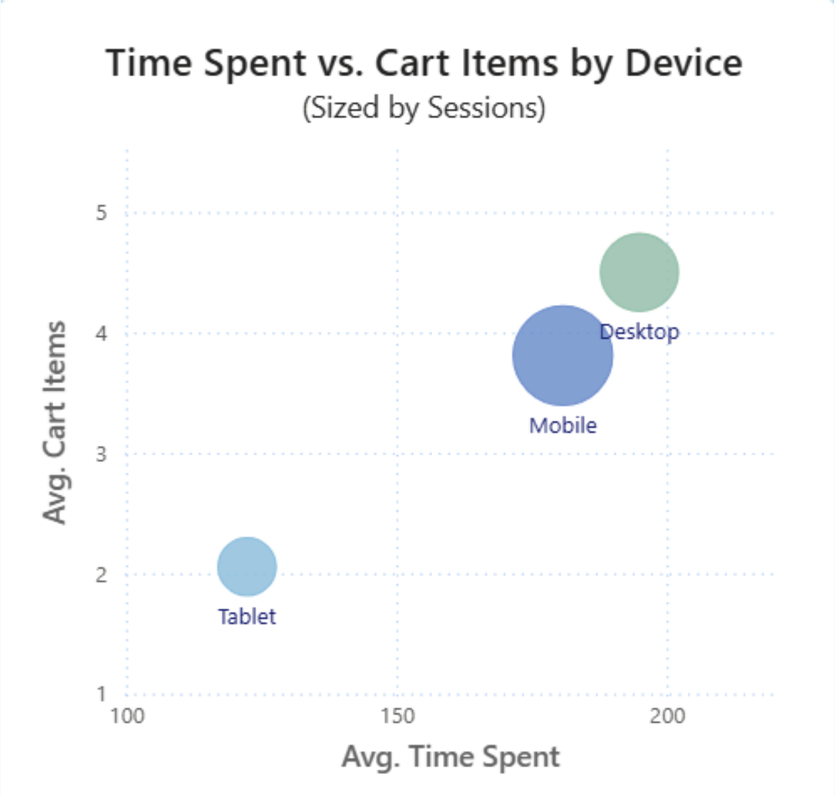
From a marketing efficiency standpoint, **Social Media is effective for reach but attracts less purchase-ready users**, whereas **Direct and Email deliver higher-quality** despite lower volumes.

Traffic Performance Analysis



Mobile leads with 2,999 sessions (53%), nearly 1.7× Desktop and 3.3× Tablet. **With over half of traffic coming from mobile, optimizing its stability, speed, and navigation offers the highest potential ROI for boosting overall conversions**.

Traffic Performance Analysis



Session duration correlates with cart intensity:

Desktop (196s, ~4 items) and **Mobile (181s, ~4 items)** show **strong engagement and purchase intent**.

While **Tablet (122s, ~2 items)**, **significantly shorter interaction time and lower cart activity**, indicating **friction in the shopping experience and opportunities for optimization**.

Traffic Performance Analysis

Device Performance Summary

Device	Total Sessions	Avg. Time (s)	Avg. Cart Items	Total Purchase	Purchase CR
Desktop	1761	195	4	276	15.7%
Mobile	2999	181	4	444	14.8%
Tablet	920	122	2	62	6.7%

Tablet consistently underperforms:

- **Conversion rate 6.7%** (less than half of Desktop and Mobile)
- **Shorter session duration**
- **Lower cart intensity**

A UX audit on Tablet devices, focusing on **layout**, **responsiveness**, and **navigation,** is recommended to **reduce friction** and **improve engagement and conversions**.

Recommendations

Strategic Recommendations

1. Optimize Product Page → Add to Cart Conversion

Improve the transition from Product Page to Add to Cart through **clearer CTAs**, **stronger value propositions**, improved **product visuals**, and **social proof** that builds purchase confidence. Apply **A/B testing** to optimize key page elements that **drive cart commitment** and **reduce drop-offs**.

2. Enhance Traffic Quality Strategy

Improve marketing effectiveness by attracting **higher-intent traffic**. **Refocus Social Media targeting and messaging** to attract **higher purchase-intent users** while **scaling Email and Direct campaigns** due to their higher conversion efficiency.

3. Mobile Experience Optimization

Maximize mobile conversion by improving **loading speed**, **simplifying navigation** and **product discovery**, and ensuring a **smooth checkout flow**. Clear CTAs and responsive design can reduce friction and convert high mobile traffic into more purchases.

4. Tablet UX Audit & Optimization

Optimize the Tablet UX by **addressing layout**, **responsiveness**, and **navigation friction**, while **aligning the experience with Desktop and Mobile benchmarks**.
